What is BMI?

Do you know what BMI means? Body mass index is a calculation that uses your height and weight to estimate how much body fat you have. Too much body fat is a problem because it can lead to illnesses and other health problems. BMI, although not a perfect method for judging someone's weight, is often a good way to check how fit an individual is.

Where Can BMI Can Fall Short?

BMI is not the whole story when it comes to someone's weight. A more muscular kid may have a higher weight and BMI but not have too much body fat. Also, a smaller kid could have an ideal BMI, but might have less muscle and too much body fat. Because of these and other considerations, it's a good idea to talk to your doctor if you have questions about whether you are at your ideal weight.

What does your BMI number mean?

Your BMI number will put you in one of 4 Categories:
- Underweight = <18.5
- Normal weight = 18.5-24.9
- Overweight = 25-29.9
- Obesity = BMI of 30 or greater

How Do I Calculate my BMI?

BMI calculation is based on height and weight measurements.
You will now calculate your own BMI based on your current height and weight.

Fill in the following information, and then use the chart on the back of this worksheet to calculate your BMI

Height: _______feet, _______inches
Weight: _______pounds
BMI Number:_______
Category: (circle one) Underweight   Normal Weight   Overweight   Obese
